

## Programming task

### Anagram checker

Create a web page that lets a user input two strings and then tells the user whether the two strings are anagrams of each other. This problem can be completed with HTML, CSS and JavaScript, but you may use any programming language you choose.

### Hosting the web page

If you're able to, please host this webpage online for us to view directly in a browser. For example, you may use Google App Engine, [BitBalloon](#) (a free static site hosting service) or any other similar free service to host your code. If you have any trouble with hosting you can also email us a .zip file with all of your code.
